                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocallular carcinoma or metastatic liver tumour in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN9503-ABN97455 in a tissue sample. The method of the invention has hepatocropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying expression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, when the commence described and diagnostic markers as well as the context of the cancer and the diagnostic markers as well as the context of the cancer and t

                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a polypeptide comprising a site-specific DNA recombinase (DR1) and a membrane translocation sequence (WTS), and nucleic acids that encode such cell-permeable recombinases. The sequences of the invention are useful for stimulating site-specific DNA recombination in a cell and for determining the efficiency of protein transduction into a population of cells. The polypeptide of the invention is further useful for detecting whether site-specific DNA recombination has occurred within a cell and for identifying a compound that modulates nuclear metabolism in a cell. It is used for identifying a peptide that behaves as a membrane translocation or nuclear localisation signal (NLS) and is also useful for identifying a compound preferably an amino acid sequence that modulates the compound preferably an amino acid sequence that modulates the compound modulates trafficking, uptake, excretion or ther activity of a specific therapeutic protein, by enhancing or other activity across the blood-brain barrier. The present sequence is Bacteriophage Pl Cre recombinase DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

plant where a heterologous transgene temporarily conveys a desired plant genome. This method is useful for creating a transiently transgenic plant where a heterologous transgene temporarily conveys a desired phenotypic trait to the plant. Complete or nearly complete removal of the heterologous DNA reduces the possibility of uncontrolled propagation of the transgenic species and permits crops produced from the transgenic plants. The excision of the transgenic food products from transgenic plants. The excision of the transgenic food products from transgenic plants. The excision of the transgene occurs only after the transgenic plants. The excision of the transgenes are excised from the host genome in response to a stimulus several days continued presence of transgenes could cause concern. If transgenes are excised from the host genome in response to a stimulus several days transgenes are reduced or eliminated. The progeny of the plants are also essentially free of the transgene sequences. The method helps to reduce the transgene sequences. The method helps to reduce undesirable spread of transgenes to the environment because pollen and seeds produced from transgenes to the environment because pollen and seeds produced from transgenes to the environment because pollen and seeds produced from transgenes to the environment secues pollen and seeds produced from transgenic plants are non-transgenic technology. The present sequence represents the bacteriophage PI Cre site specific recombinase gene sequence this sequence recognises the Loxy sequence. The Cre/Lox site specific secondarion while the method in the intention to each to the intention of the plants are not transgenic technology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel method for creating a transiently transgenic plant. The method comprises introducing a gene cassette containing transgenic gene sequences conferring a desirable phenotypic trait, a recombinase-type protein, sequences cleavable by a recombinase protein and a promoter to a plant. The plant is then exposed to a stimulus that activates the promoter and directs expression of the recombinase protein which excises the heterologous DNA from the plant
                                                                                                                                                                                                                                                                                                                                                                                                         Creating a transiently transgenic plant for producing non-transgenic food products, comprises introducing a gene cassette having the genome the genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the invention to excise heterologous DNA from a plant,
